AI USAGE LOG

Agentic AI Loan Approval Demo | Deliverable D6

Purpose: Record how AI assistance was used during development, including tasks supported, validation, and limitations.

Tool	Use in this project	Validation / limitation
ChatGPT	Step-by-step guidance for the Streamlit loan approval demo, Python/MySQL workflow, CSV preparation, and supporting pages (Architecture, Approach Story, FAQ, Contact Us).	Instructions and generated content were applied and checked in the local app; supporting pages were opened and reviewed.
ChatGPT	Helped structure the research note around loan approval stages, roles, documents, turnaround times, workflow challenges, and published sources.	Published bank sources were included. A practitioner interview has not been conducted and is not claimed.
ChatGPT	Helped explain and troubleshoot implementation tasks while preserving the existing working app and backup.	Changes were applied incrementally. MySQL/CSV and fictional demo data are used; BigQuery and live LLM agents are not connected.

Representative prompts / requests

- "Help me build the loan approval demo step by step without breaking the working app."
- "Prepare the Architecture, Approach Story, FAQ and Contact Us pages for the assignment."
- "Prepare a research note according to the loan approval assignment requirements."

What worked: Breaking work into small steps, checking each page in the running app, and keeping the data source and current implementation clearly documented.

Corrections / safeguards: Kept claims aligned with what is actually implemented; used fictional applicant data; did not claim live bank integrations, connected BigQuery, autonomous LLM agents, or a practitioner interview.

Time saved: Not measured. Add a realistic estimate only if you can support it from your own experience; no time-saving figure has been invented.

Other AI tools: Claude Desktop / Claude Code were not used for this project. ChatGPT was the AI assistant used.

Human responsibility: The project owner reviewed the output and tested the app. AI-generated suggestions were treated as assistance, not as proof of correctness. The demo is educational and does not make real lending decisions.
